Module 4: Build a Simple Interface

Prototype Overview

A self-contained HTML/CSS/JS webpage was created using AI-assisted coding. The interface follows a clean light professional style chosen for readability during extended agent use. It includes a text area for pasting a customer ticket and an Analyze Ticket button. Results appear in structured cards showing Summary, Category, Priority, Recommended Team, and Human Review flag.

Interface Screenshots (from the working prototype)

Figure 1: Empty interface ready for ticket input

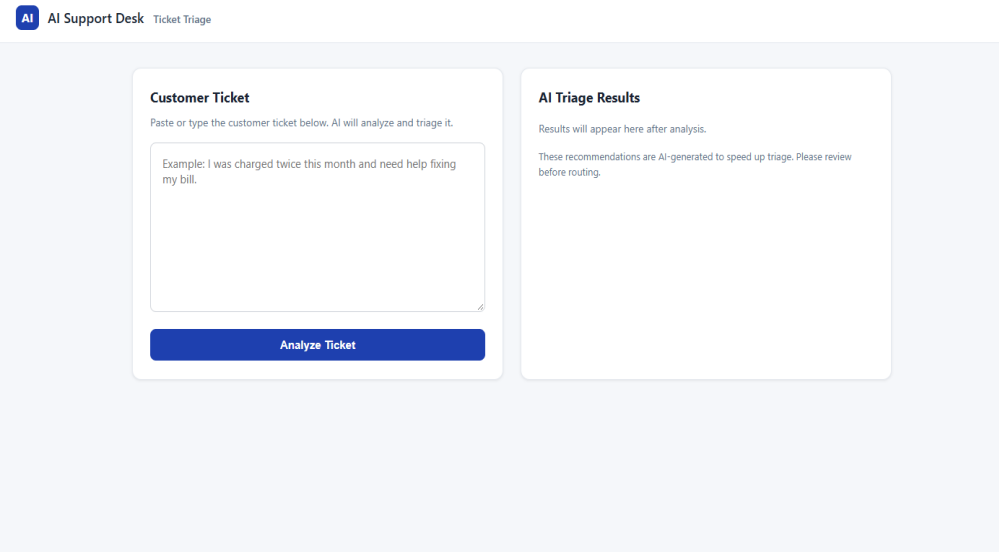

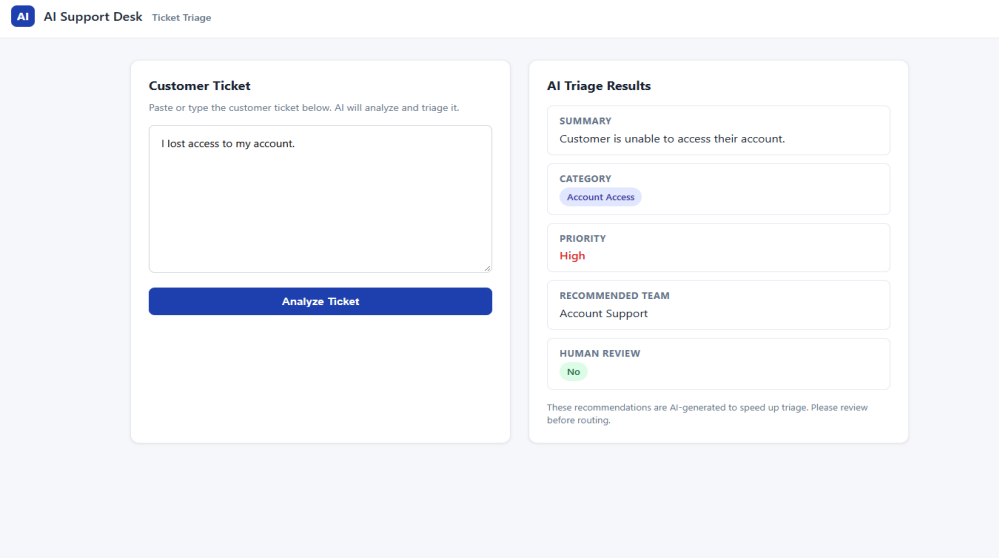

Figure 2: Results after analyzing "I lost access to my account."

How AI Assisted

AI coding assistance was used to generate the initial HTML structure, CSS styling for the clean light professional theme, and the client-side logic that maps ticket text to the defined categories, priorities, and human-review flags. The logic was then refined to match the input/output plan from Module 3 and tested against the sample tickets.

Prototype Evidence

The working prototype is provided as a single HTML file (AI_Support_Desk_Triage_Prototype.html). It can be opened directly in any browser or edited in VS Code. The screenshots above were captured directly from the running prototype.

This completes the Module 4 deliverable of a simple coded interface that demonstrates the triage workflow from ticket input to AI suggestion, with clear space for human review.
