# Module 5: Connect Roles and Maintenance

## Roles and Responsibilities

| Role | Responsibilities | Frequency |
|---|---|---|
| Support Operations Lead | Owns the category list, priority definitions, and human-review rules. Approves changes. | Ongoing |
| AI / Prompt Engineer (or Developer) | Maintains the triage logic or prompt, tests new ticket types, updates the prototype/code. | As needed |
| Support Agents | Use the tool daily, flag incorrect results, provide feedback on usefulness. | Daily |
| Support Manager | Reviews flagged tickets and agent feedback, decides when rules need adjustment. | Weekly |
| Security / Compliance Reviewer | Reviews any security or privacy-related escalations and confirms sensitive cases are handled correctly. | As needed |

## Maintenance Plan

- Categories and escalation rules are reviewed monthly or after any major product change.
- Agent feedback on incorrect classifications is logged and reviewed weekly.
- The prototype logic is updated only after human review of the proposed change.
- A simple change log is kept so everyone knows what was updated and why.

## Skills Needed to Turn the Prototype into a Real Product

- Basic web development (HTML/CSS/JS or a simple framework) to keep the interface maintainable.
- Prompt engineering or lightweight rule design so the triage stays accurate as new ticket types appear.
- Understanding of support workflows and escalation paths.
- Responsible AI practices: knowing when to require human review, how to test for bias or missed high-risk cases, and how to document limitations.
- Collaboration skills so developers, support leads, and agents can update the system together.

This plan keeps humans responsible for the rules and for any final decisions, matching the project’s responsible-AI focus.
